

# 60kW Data Center Rack for Network Server Room

## Overview

---

Is 12 kW enough for a data center?

According to AFCOM's 2024 State of the Data Center Report, average rack density now sits around 12 kW. That's 2x the 6.1 kW per rack they initially reported in 2016. Despite doubling average density in just eight years, 12 kW still isn't enough. Data center operators are being asked to support 30 kW+ per rack.

What percentage of data centers have less than 10kW racks?

It's important to note that 37 percent of data centers still have racks of less than 10kW. There are three key reasons why these data centers have not seen substantial increases in rack density. Server virtualization has been around for decades, and containerization has been used for several years.

What is a data center server rack?

A data center server rack is critical for managing and organizing IT equipment. It supports hardware, enhances cooling, and ensures efficient power distribution. Choosing the right server rack involves understanding key dimensions, types, and features. This guide covers everything you need for making the best selection for your data center.

How tall is a server rack in a data center?

The most common height for server racks in data centers is 42U, which translates to a height of 73.5 inches. This size is preferred due to its ability to accommodate a significant amount of equipment while maintaining manageability, including rack unit indicators.
