Advanced and hybrid energy storage technologies offer a revolutionary way to address the problems with contemporary energy applications. Flexible, scalable, and effective energy storage is provided via thermal-electric systems, battery-supercapacitor hybrids, and high-performance supercapacitors.

Combining two or more energy storage technologies creates systems capable of leveraging the strengths of each individual technology while mitigating their respective weaknesses. For instance, pairing a battery's rapid response capabilities with the long-duration discharge potential of pumped hydro.

In order to improve the operation reliability and new energy consumption rate of the combined wind-solar storage system, an optimal allocation method for the capacity of the energy storage system (ESS) based on the improved sand cat swarm optimization algorithm is proposed. First, based on the.
