The company founders, Kai F. Pedersen and Knud V. Jensen, built one of the world's first electrical control systems for a wind turbine, the Riisager 22kW turbine. We continue to develop early control systems for wind turbines. It is installed in a 50kW.

We develop and manufacture advanced control systems and tailored control panels engineered for low operational costs and maximum performance, reliability and safety. From pioneering one of the first electrical control systems for wind turbines, we have been leaders in renewable energy control.

Our strategic framework is meant to differentiate and accelerate our business. Keeping a strong focus on our uniqueness will inspire both daily execution and future innovation towards making the biggest possible difference for our customers, employees and society in general. Our founders develop.

Figure 1: Schematic of the wind turbine functional control elements. The wind farm controller's function is "power management". It can initiate and shut down turbine operation as well as co-ordinate the operation of numerous wind turbines in response to environmental and operating conditions. The.

In this paper, we first review the basic structure of wind turbines and then describe wind turbine control systems and control loops. Of great interest are the generator torque and blade pitch control systems, where significant performance improvements are achievable with more advanced systems and.

Primarily focused on modern variable speed, pitch controlled wind turbines. Would like to get as much energy out of wind turbine as possible. Noise restrictions limit the tip speeds of wind turbines to ~80 m/s. Ensure that turbine operates safely by limiting the forces. Sometimes these objectives.

A wind turbine controller is a critical component in the operation of wind turbines,

responsible for monitoring and controlling various functions to optimize performance and ensure safety. These controllers are designed to handle the challenging conditions found in wind turbine environments.
