## Overview

In this article, we explore the current state of research on hybrid systems that combine solar power systems with coal-fired units, focusing on three primary integration approaches: solar-assisted steam-water heating, solar-aided carbon capture, and solar thermal storage.

Retired coal power plants provide a ready opportunity for redevelopment into clean energy infrastructure, including new solar and storage projects. Existing land and facilities at the power plant site can be repurposed, including disturbed lands for solar arrays and electricity infrastructure for.

As the global energy landscape shifts toward sustainability, integrating renewable sources like solar energy with conventional coal-fired power plants has emerged as a promising strategy to enhance efficiency and reduce emissions. In this article, we explore the current state of research on hybrid.

This year's sharp U-turn in federal energy policy has added new life to some of the nation's old, outdated coal power plants, as Energy Secretary Chris Wright issues a series of "emergency" orders requiring them to keep churning the carbon-loaded kilowatts. Nevertheless, the age of cleaner, more.
